

EatClub Web Frontend Technical Challenge

Your mission, should you choose to accept it, is to build a small React web app.

Keep it simple

We anticipate that this challenge will only take approximately 2-3 hours to complete. Please do your best to complete this task without going too far into detail, we are looking for a result that gives an indication of your technical skill.

How to submit your solution

Submit your project by emailing us:

- A public GitHub repository link.

Push a few commits showing how you incrementally built your solution and solved problems.

- Include a couple of screenshots of your working app in your email.
- We will discuss your solution in the next round interview.

We may ask you for a simple demonstration of your app working by showing it running on your local computer via screen share.

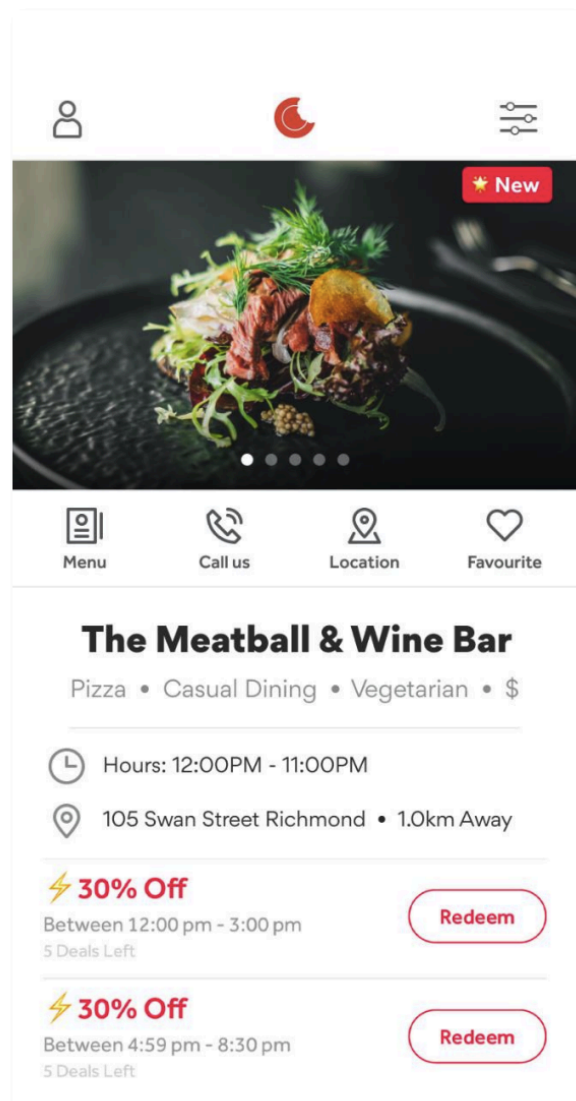

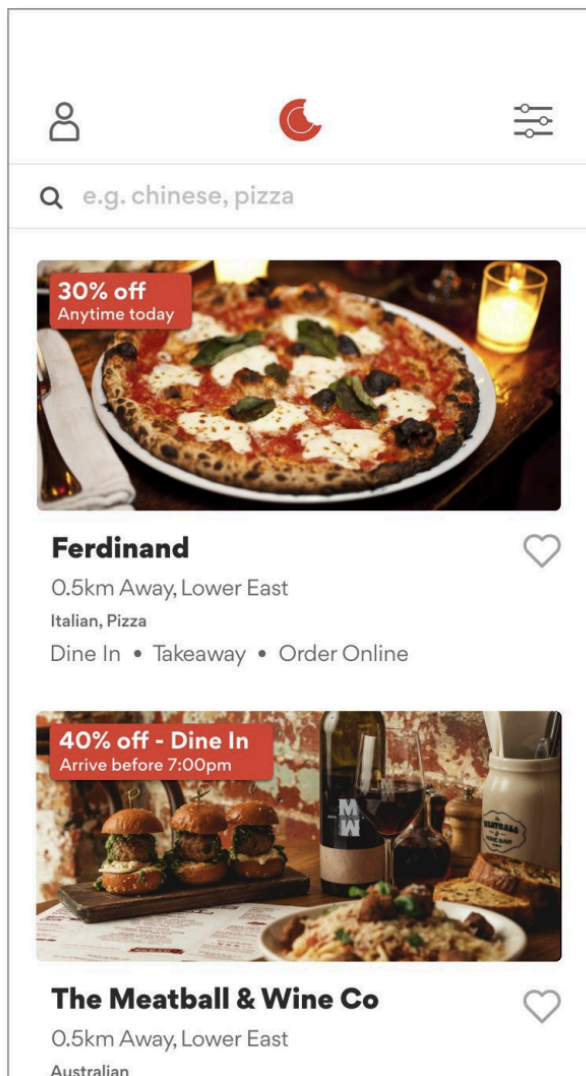

React App

Design and build a small React app.

Screens should be designed for mobile.

For bonus points make the screens responsive with layouts that work on desktop.

The app should have the following screens (See the next page for details).

1. Create and configure a new project
2. Interaction flow:
 - a. When the app launches, the first screen should be "Restaurant List".
 - b. In the Restaurant List, tapping a restaurant card will go to "Restaurant Detail screen" showing details for that restaurant
 - c. Pressing back will return to list view
3. Restaurant List screen
 - a. Fetch Restaurant list from json API endpoint (see below)
 - b. Show a list of restaurant cards as shown in the design
 - c. Sort cards by best deals first.
 - d. Implement search filter functionality - filter by partial name, and cuisines

Note: No need to implement the "Favourite" button
4. Restaurant Details screen
 - a. Show Deal cards
 - b. Sort deals by highest discount

Note: No need to implement the "Menu/Call Us/Location/Favourite" button actions

The API endpoint exposing JSON mock data is accessible here:

<https://eccdn.com.au/misc/challengedata.json>

The app should fetch from that url on load.

Your app does not have to be an exact match to the screens above, but do your best to get the core structures in.
